## Jumping Path

*Time limit: 10 seconds*

You are given a rooted tree where each vertex is labeled with a non-negative integer.

Define a *Jumping Path* of vertices to be a sequence of vertices  $v_1, v_2, \dots, v_k$  where  $v_i$  is an ancestor of  $v_j$  for all  $i < j$ . Note that  $v_i$  is an ancestor of  $v_{i+1}$ , but not necessarily the parent of  $v_{i+1}$  (hence the *jumping* part of a *jumping path*).

Compute two quantities:

- The length (number of vertices) of the longest *jumping path* where the labels of the vertices are nondecreasing.
- The number of *jumping paths* of that length where the labels of the vertices are nondecreasing.

### Input

The first line of input contains an integer  $n$  ( $1 \leq n \leq 10^6$ ), which is the number of vertices in the tree. Vertices are numbered from 1 to  $n$ , with vertex 1 being the tree root.

Each of the next  $n$  lines contains an integer  $x$  ( $0 \leq x \leq 10^6$ ), which are the labels of the vertices, in order.

Each of the next  $n - 1$  lines contains an integer  $p$  ( $1 \leq p \leq n$ ), which are the parents of nodes 2 through  $n$ , in order.

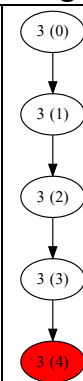

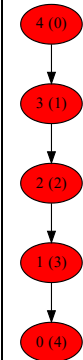

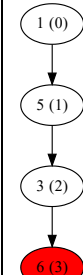

It is guaranteed that the vertices form a single tree, i.e., they are connected and acyclic.

### Output

Output a single line with two integers separated by a space.

The first integer is length of the longest *jumping path* where the labels of the vertices are nondecreasing. The second integer is the number of *jumping paths* of that length where the labels of the vertices are nondecreasing. As the second integer may be large, give its value modulo 11092019.
